Project 1:

Create Your Own Simple Personal Page (by Modifying HTML code)

Project Instructions

Your Starter Files are available in the project directory.

Use an image file to represent yourself and a new image for the background. Keep the profile image under 400 KB and the background image under 1 MB. (you can use http://picresize.com/ for resizing your pictures)

Using an editor, modify the HTML of the index.html file:

* Add the images you collected in previous step to the page. Do not change "class" or "id" attributes. Only update the text for your new profile image's alt attribute.

Personalize all the text on the page by changing the name, background and goals. Feel free to make up the information if you do not wish to share anything personal.

Add links to your professional social media or portals such as GitHub, Twitter and LinkedIn accounts. If you don't have a Twitter or LinkedIn account, or don't want to share those, then delete those links. We will discuss GitHub in the upcoming sessions.

Edit the href value of the Home link so it navigates to index.html. Note: do not use root relative links, or links that begin with a leading forward slash, /.

Feel free to expand on this project, by adding an additional page or two, adding more images and customizing the CSS. If you do not want to add an additional page then delete the experience link in the HTML.

The following descriptions are for next week:

We will put the project files in a new GitHub repository on your GitHub account (will be discussed later):

* Make sure that you're only putting the files for this project in that repository.

* Please do not create any new folders for this project.

Make sure to check your code is valid by running it through an HTML and CSS validator.

* There are a few exceptions that you don't need to fix:

  * Don't worry about any warnings, we just need you to check any errors that might be there.

  * If CSS validator flags use of calc, vendor prefixes or pseudo-elements/pseudo-classes these errors should be ignored.

* If HTML validator flags use of pipe (|) in Google font links/URLs this error can also be ignored.

NOTE: A good practice is to check your project for cross browser compatibility. Making sure that it looks and functions correctly in multiple (at least three) browsers. If you want, leave a comment to the project reviewer about which browser(s) the project was checked to ensure they are seeing things as you have designed them.

Extra Credit

Create additional pages to expand on this online profile.

Edit the styling of the profile photo's CSS properties. Pick at least one of the following properties to change:

* border

* border-radius

* transition

Add more photos and imagery to the page

Add more text to the page, such as a list of your hobbies.
